DATA CLEANING REPORT

PlaySafe

First Inspection

Objective

The objective of the data cleaning process was to prepare the dataset for further analysis and modelling while keeping the original data unchanged.

Cleaning Process

The following cleaning steps were performed:

- Standardised missing values and identified different representations of missing data.
- Converted numerical variables from strings to appropriate numeric data types.
- Standardised date variables and converted them to a consistent date format.
- Removed unnecessary text from numerical variables such as height and days out.
- Investigated potentially redundant variables, such as current_age_x and current_age_y.
- Checked inconsistent values and unusual entries before deciding how to handle them.
- Investigated encoding issues in player names.
- Checked the dataset after cleaning to ensure that the transformations were applied correctly.

Data Integrity

The original dataset was kept unchanged and a separate cleaned dataset was used for the transformations. This allows the cleaning decisions to be reviewed and the original data to be recovered if necessary.

Result

After the cleaning process, the dataset is structured in a consistent format and is ready for the next stage of the project: exploratory data analysis and feature analysis.

The cleaning decisions were documented to ensure that the process is transparent and reproducible.
